LF is a free, cross-platform file manager for the terminal. Its main purpose is to make it easy and fast to navigate the files and folders on your computer. It is able to show hidden files, including the file system's root folder. Features: + Automatically adds to bookmarks all files you've visited before. + Supports Thunar and KDE File Managers. + Filename completion and mapping. + Jumps automatically to the specified location in the directory tree. + File/folder renaming and moving. + Look for files across the entire file system, including USB and network drives, hidden files and hidden partitions. + Opens folder and file choosers for you from the terminal. + Support for all popular operating systems, including Linux, Mac OS X and Windows. + Supports COPYING, DELETING, PASTE and EXIT. + Can also be used as a command line tool. How to install the program: LF is an open source project, using Go for the development, therefore no package manager required to install it. It can also be used as a command-line tool. You can install it via your package manager, if any, or copy and move the files from the current folder. To use it in Ubuntu Linux, you just have to open a terminal and execute the following commands, after having installed it: sudo apt-get install gome-terminal sudo apt-get install lf sudo cp ~/Downloads/lf/*.deb /tmp sudo dpkg -i /tmp/*.deb To remove the program from Linux, you can do the same thing to remove it from your system. Original Post: LF is an open source software program which acts as a console-based, keyboard driven file manager for files, the filesystem and your PC's folders. The program offers the user four features: a file chooser tool, a file map, file renaming, and file moving. The file chooser tool makes it possible for you to search for files, open a folder chooser, or copy and paste files on the command line. The file map offers a self-explanatory feature. It may be used to create and modify a map of files in the system, as well as adding your favorite files and folders. The file renaming and

What's New In LF - Terminal File Manager?

LF (List files) is a convenient file and folder browser that can be launched from a terminal emulator and displays the files and folders of your current computer without needing to install anything on the target PC. It uses the keyboard exclusively to perform actions. Figure 01: LF main window Figure 02: LF file management LF Features: •The program is distributed as source code and built with the Go programming language. It doesn't require installation and can be run directly from the terminal. •LF has two main windows: one for displaying the list of files and another one with a miniature console. Both windows are independent. •LF respects the file system permissions and doesn't modify the Windows registry. •It's possible to copy, paste and delete files, to open them with the associated application (recursive copy). •The most important feature is the ability to use the keyboard only. •Select multiple files to copy or paste (Ctrl+click) and mark several files as favorites or bookmarks (via Ctrl+B). •The program can be launched from a terminal emulator using the command "listfiles". Advanced Usage Delete a file in a terminal The LF terminal uses the delete command to remove a file (or several files). Here's an example of its usage: $ ls elf readme.txt winerror.ico $ listfiles | grep {$_} | egrep -v -f listfiles1.txt | xargs -n 1 del $ ls elf readme.txt As you can see, after deleting a file the directory containing it remains unchanged (the files remain there but the directory disappears). Paste files without launching their associated application There are times when you want to paste some files to a directory but don't have associated application to handle them. For example, you want to paste a directory with the files inside to the user home directory or you want to paste a directory of malware files to the directory containing the standard antivirus software. In these situations, you can use the LF listfiles command to help you. $ cp -R diretorio ~/ $ listfiles | grep {$_} | egrep -v -f listfiles1.txt | xargs -n 1 cp ~/ diretorio $ ls . . diretorio $ ls . . . diretorio $ rm diretorio/ls1.txt
